Claims captured at the bedside are the ones HMOs accept, and Carbon can fund.

HospitlOS is our hospital operating system. Its capture layer records care as it happens and builds the HMO claim from it, so the claim leaves the hospital clean and carries its own evidence.

Illustrative screen. Claim data is invented.

AT THE BEDSIDE

Every service, drug and test is recorded as it is given, with who did it and when. The claim is built from that record, not typed up weeks later from a folder.

BEFORE IT LEAVES

Each claim is checked against the HMO's contract: pre-authorisation code, tariff, documents. A missing code shows as a query here, not as a rejection two months later.

FOR CARBON

A funded claim carries its trail from admission to the HMO's acceptance, so Carbon can see what it is lending against and why the HMO will pay.

WHAT IT CHANGES IN THE PILOT

More fundable

fewer queries, so more claims reach acceptance

Fewer days

faster acceptance, so less interest for the hospital

Priced on evidence

each HMO's record, claim by claim
