CONSULT FOR AFRICA
Build. Transform. Grow.

PREPARED FOR SEGUN OYEWOLE

Selling a harvest you have not cut yet

The software for a direct to customer produce box, and the one constraint that makes it unlike ordinary retail.

PREPARED FOR	PREPARED BY	SCOPE	DATE
Segun Oyewole	Consult for Africa	Phase one, build and launch	October 2026

Private and confidential. Prepared for Segun Oyewole and not for onward circulation.

You asked for a mobile app. We would build the thing that installs like one.

A progressive web app is a website that a phone treats as an application. It takes an icon on the home screen, opens without a browser bar, works on a weak signal, sends notifications, and can be listed on Google Play under your own name. It is one codebase rather than three, which is most of why it costs what it costs.

- **Your buyers are on Android.** Between 83 and 88 per cent of Nigerian phones, depending on whether you count handsets owned or pages browsed. Android is where a progressive web app is strongest and where every gap in it disappears.
- **You will change this weekly.** Box contents, prices, delivery zones and cut off times move with the harvest. A web release is live when you deploy it. A native release waits for review.
- **It is not a dead end.** The backend, the payment integration and the design system are the same assets a native app would use. Going native later is an addition, not a rebuild, if the first build is made for it.

WHAT YOU GET

Home screen icon
no browser bar

Google Play listing
your name, your logo

Push notifications
harvest day, order ready

Face ID sign in
passkeys, not passwords

Works offline
order queues, sends on signal

One codebase
phone, tablet, desktop

We have put the case against this recommendation on page seven, with the numbers, because you should buy it knowing what it costs you.

Everybody who has tried this in Lagos with their own warehouse and their own fleet has closed.

This is not a reason to stop. It is the reason the software has to be scoped the way it is below, and the reason we will argue against building you half of Chowdeck.

Who	What they built	What happened
GoLemon	Founded by people from Paystack. Direct farmer sourcing, their own warehouse, their own technology, their own riders.	Stopped taking orders on 29 July 2026, after about 28 months. They had done N2bn of sales across 57,000 orders to 40,000 registered customers, at an average basket of N43,700. The orders made money. Eighty a day never covered the warehouse, the engineers and the fleet underneath them.
Jumia Food	Restaurant and grocery delivery at national scale, inside the largest e commerce business on the continent.	Closed in December 2023 across Nigeria and six other markets. Reported to have lost about one dollar ninety on every ten dollars ordered.
Fresh Direct Nigeria	Container farm hydroponics in Abuja and Lagos, sold on an organic premium. The closest thing to your model anybody has run.	Closed. It is the comparator a sceptical investor will raise, so it is better that you raise it first.
Bolt Food	A funded international operator with a rider network already in place.	Exited Nigeria in December 2023.
FoodCourt	Cloud kitchens in Lekki, Obanikoro and Abuja, backed by Y Combinator.	Paused operations in 2026 after unpaid salaries.

None of them died of weak demand. They died carrying a fixed cost the order book could not reach. You already own the farm, the produce and the margin. The software must not put a second fixed cost business on top of it.

You are the only one in that list who was not buying from Mile 12.

Everybody on the previous page bought produce somebody else grew, through a chain that loses about half of it on the way. You grow it, you cut it, and it can be in a box the same morning.

About half

of Nigeria's fresh produce is lost between harvest and plate, on USAID's estimate. Tomatoes run 45 to 60 per cent, leafy vegetables 40 to 50.

46 per cent

the average premium Nigerian consumers said they would pay for organic leafy vegetables in a published survey, with 84.5 per cent willing to pay something above the market price.

N120k to N300k

what an upper middle or expatriate Lagos household budgets for groceries in a month. Fifty two boxes a year at your price is a share of that, not a stretch beyond it.

N8,000 a week

what SwanCape Farms currently charges for a weekly veg box in Lagos, ordered over WhatsApp. That is the live price in the market, and it is the number your pricing argues against.

The ceiling is worth saying out loud. Around seven in ten naira of Nigerian food retail still goes through open air markets and roughly three per cent through supermarkets. This is a narrow premium segment that can be won, and it is not a mass market.

Sources: USAID via Nairametrics, April 2024. Published Nigerian survey on organic leafy vegetables. USDA Foreign Agricultural Service, Lagos 2024. SwanCape Farms published price, October 2026.

Where your customers actually are, and what they pay to reach you.

The figures below are the reason the recommendation goes the way it does. They are current, sourced and dated, and they are the part of this argument that is not a matter of taste.

What it is	The number	Why it decides this
Android share of Nigerian phones	88 per cent owned 83 per cent of browsing	KPMG and Orange, 13,251 respondents in 12 cities, September 2026, against StatCounter traffic, June 2026. Every durable weakness in a web app is an iPhone weakness, and iPhones are 12 to 17 per cent of this market.
Smartphone ownership in Lagos	81 per cent	Up from 78 in 2023, and among the highest in the country. The customer you want is already carrying the thing you would ship to.
Cost of a gigabyte	Up 65 per cent since January 2025	The NCC approved the first tariff rise in a decade. The regulated floor moved from N287.50 to N431.25, and retail sits between N350 and N750.
Install conversion against app size	About 1 per cent lost per 6MB	Google's own Play Store analysis, and the effect runs roughly two and a half times stronger in emerging markets. Jumia's own Android app is under 25MB and it still ships a separate lighter build.

Sources: KPMG and Orange Group via Technext, September 2026. StatCounter, June 2026. NCC tariff determination, January 2025. Google Play developer research on package size and install conversion.

What you lose by not building a native app, on Android, is nothing you have asked for.

The worry behind wanting an app is usually that a website will not feel like one and will not be anywhere a customer can find it. Neither is true on the platform your customers are on.

What you want	How it is delivered	Caveat
An icon on the home screen	Chrome and Samsung Internet generate a real Android package on install. It appears in the app drawer, the app switcher and in Settings.	None on Android.
A listing on Google Play	Published as a Trusted Web Activity. One off developer fee of twenty five dollars, a Lighthouse score of 80 or better, and a domain verification file.	Google sanctioned and current. Apple has no equivalent route.
Notifications	Supported on Android, and on iPhone since Safari 16.4 once the customer has added the site to their home screen.	On iPhone the home screen step comes first, and many people never take it.
Sign in with Face ID or a fingerprint	Passkeys reach Face ID, Touch ID and Android biometrics from a web app. Apple supports this fully.	Not a native advantage any more.
Working on a weak signal	The order queues on the handset and sends itself when the signal returns.	Reliable on Android. iPhone does not support background sync.

Where you are right, and a native app genuinely wins.

Three of these are real and one is not, and the one that is not is the argument most often used to sell against native. We would rather tell you now than have you find it later.

- **Live driver tracking.** Watching a van move across a map while the customer's phone is in their pocket needs background location, and no web app on either platform can do it. If that feature matters on day one, it is the one honest reason to go native.
- **Notifications on iPhone.** They work, but only after the customer has added you to their home screen, and most people never do. On the 12 to 17 per cent of your market using iPhones, assume you will reach them by WhatsApp and email rather than by push.
- **The App Store itself.** Apple rejects wrapped websites under its minimum functionality rule. There is no route onto the App Store for this that does not involve writing native code. If being on the App Store matters to a partner, a franchisee or an investor rather than to a customer, that is a legitimate reason and it has nothing to do with conversion.

> **The argument we are not going to make: Apple's 30 per cent commission does not apply to you. It covers digital goods, and produce is a physical good, so Apple would take nothing from a box sold through an app.**

If you want a native app in a year, this is what today's decision costs you.

Most of what gets built in phase one is not web specific. The answer to the question is a number, and it is smaller than the cost of guessing wrong now.

CARRIES OVER UNTOUCHED

- The database and every order, customer and harvest record
- The whole backend and the interfaces the app talks to
- Payment integration and the server side verification
- The box rules, the substitution logic, the pricing engine
- The design system and the component library
- All of your content and photography

WHAT IS ACTUALLY LEFT TO DO

- Wrap the existing build in a native shell and add the native parts, which is two to four months of work rather than a rebuild
- Or rewrite the interface layer properly, which is around three months and gives a cleaner result
- Apple charges ninety nine dollars a year to stay listed, and a release waits for review every time

We would build phase one so that this stays a two month job rather than a rebuild. That is an architectural choice made in week one and it costs nothing extra to make it now.

This is not a shop. You are selling stock that does not exist when the customer pays for it.

An ordinary e commerce build assumes a warehouse: a known number of a known thing, sitting on a shelf, reserved the moment somebody buys it. Nothing about a greenhouse works that way, and this is where a general developer will build you something that breaks in week three.

An ordinary shop assumes	You actually have	So the software must
A unit of stock on a shelf	A forecast yield from a bed, which lands within a window and comes in over or under	Hold capacity rather than inventory, and sell against a forecast that tightens as the week runs
Anything can be bought at any time	A cut off, after which the pick list is fixed and the harvest is planned	Run ordering in weekly cycles with a hard cut off and a visible countdown
The customer chose exactly this item	A box whose contents change every week with what is ready	Publish the week's box, carry a substitution rule per line, and tell the customer before they are surprised
Unsold stock waits	Produce that is worthless in four days	Route surplus somewhere automatically, into a discounted box, a standing wholesale buyer or a donation, without anybody remembering to
Demand is the thing you grow	Demand and supply have to meet in the same week	Show both on one screen, so a sales push is never run into a week you cannot fill

Five parts, built in one go, because they only work together.

01

The customer app

Browse the week's boxes, order once or subscribe, pay, pick a delivery window, track the order, reorder in two taps.

02

Subscription and payments

Card on file, wallet top up and bank transfer, pause and skip a week, automatic retry when a card fails, and a fallback that does not lose the customer.

03

Harvest and box console

Capacity by site and bed, the week's box built against forecast yield, cut off control, substitution rules, pick lists and surplus routing.

04

Delivery and WhatsApp

Routes and manifests for the weekly drop, proof of delivery, and ordering, reminders and receipts over WhatsApp for the customers who will never open an app.

05

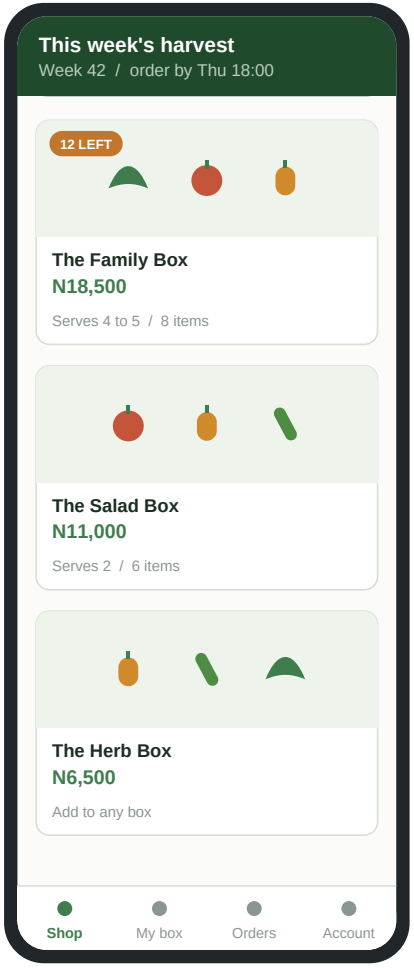

The admin portal

Where you set all of it up without calling us: boxes, prices, zones, cut offs, delivery windows, users, discounts and the reports that say whether this is working.

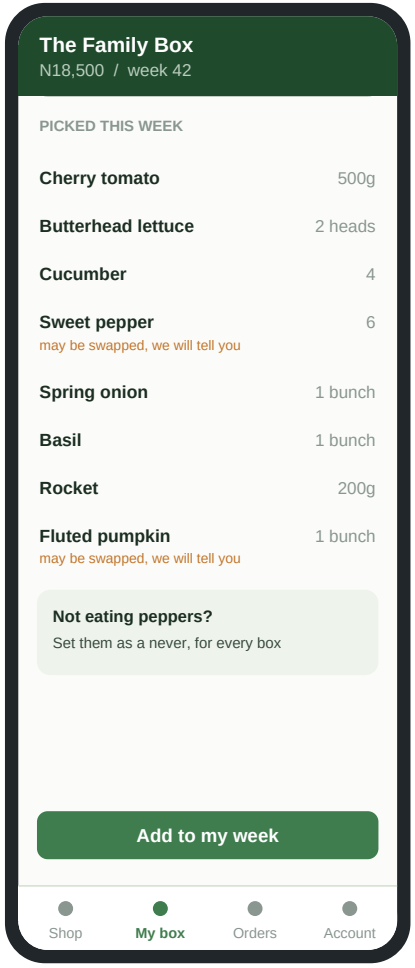

The console is the part a cheaper quote leaves out, and it is the part that decides whether you can run this at two hundred boxes a week without three people on WhatsApp.

The customer app.

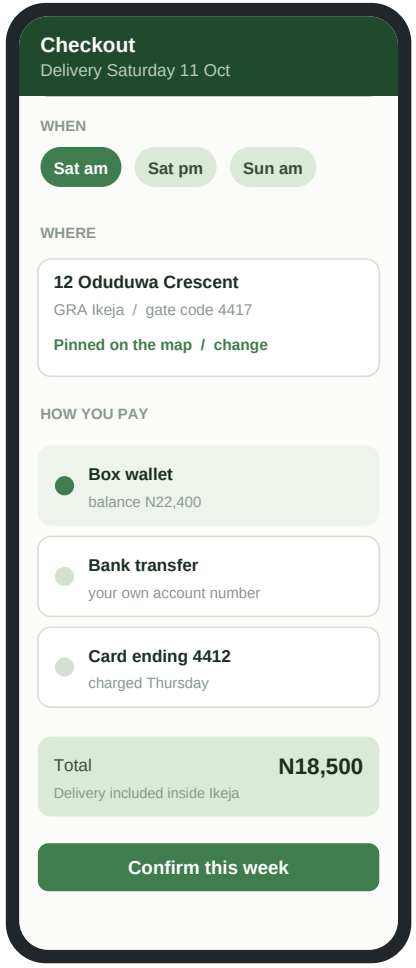

Indicative layout and order of information, not a finished design. Colour and photography follow your brand.

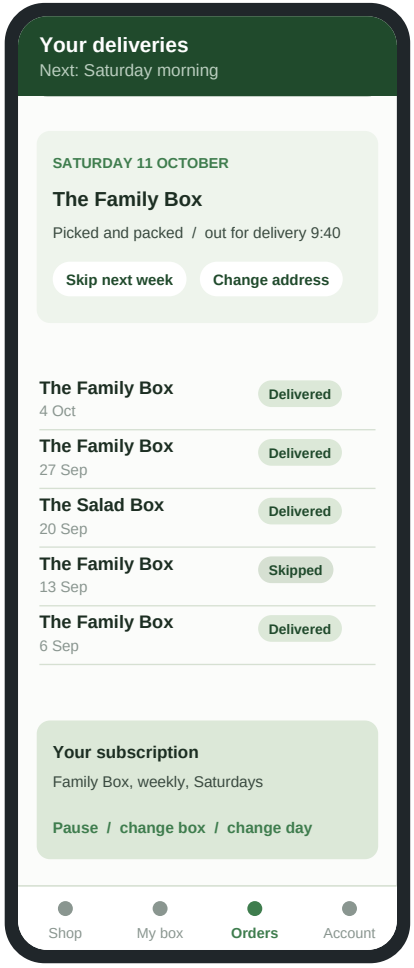

THIS WEEK

WHAT IS IN IT

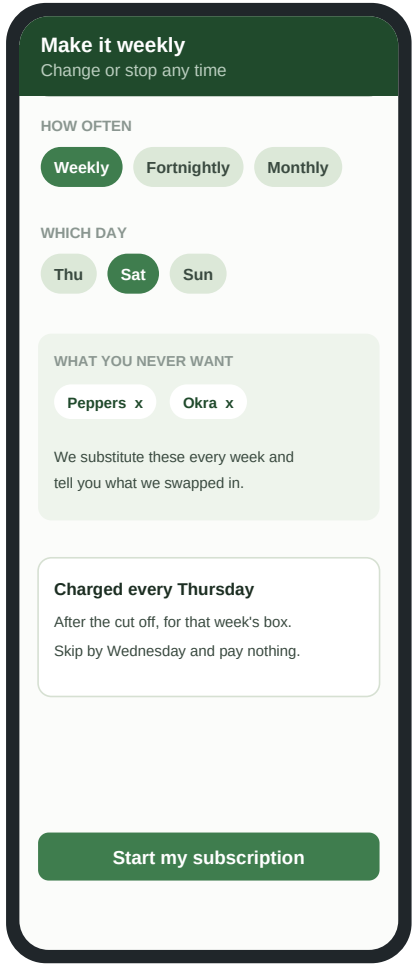

CHECKOUT

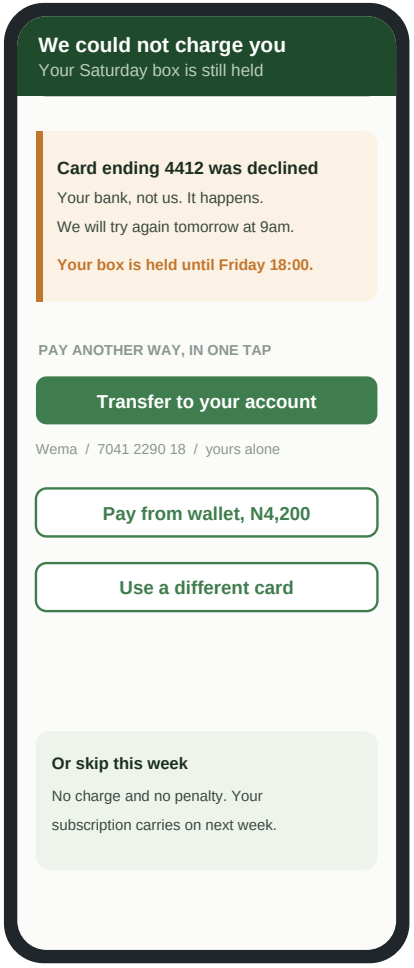

AFTER THE ORDER

The subscription, and what happens when a card fails.

Recurring billing on Nigerian consumer cards fails often enough that the recovery path is a product decision rather than an edge case.

SETTING IT UP

THE CARD FAILED

WHY THIS SCREEN EARNS ITS PLACE

Paystack does not retry.

A failed subscription charge is not attempted again. It moves to an attention state and waits for somebody to do something, which is why the retry ladder has to be ours rather than theirs.

A Verve card cannot auto renew at all.

Paystack says so plainly. A meaningful share of Nigerian debit cards therefore cannot carry an automatic subscription, and a build that assumes they can will quietly lose those customers.

So the box is held, not cancelled.

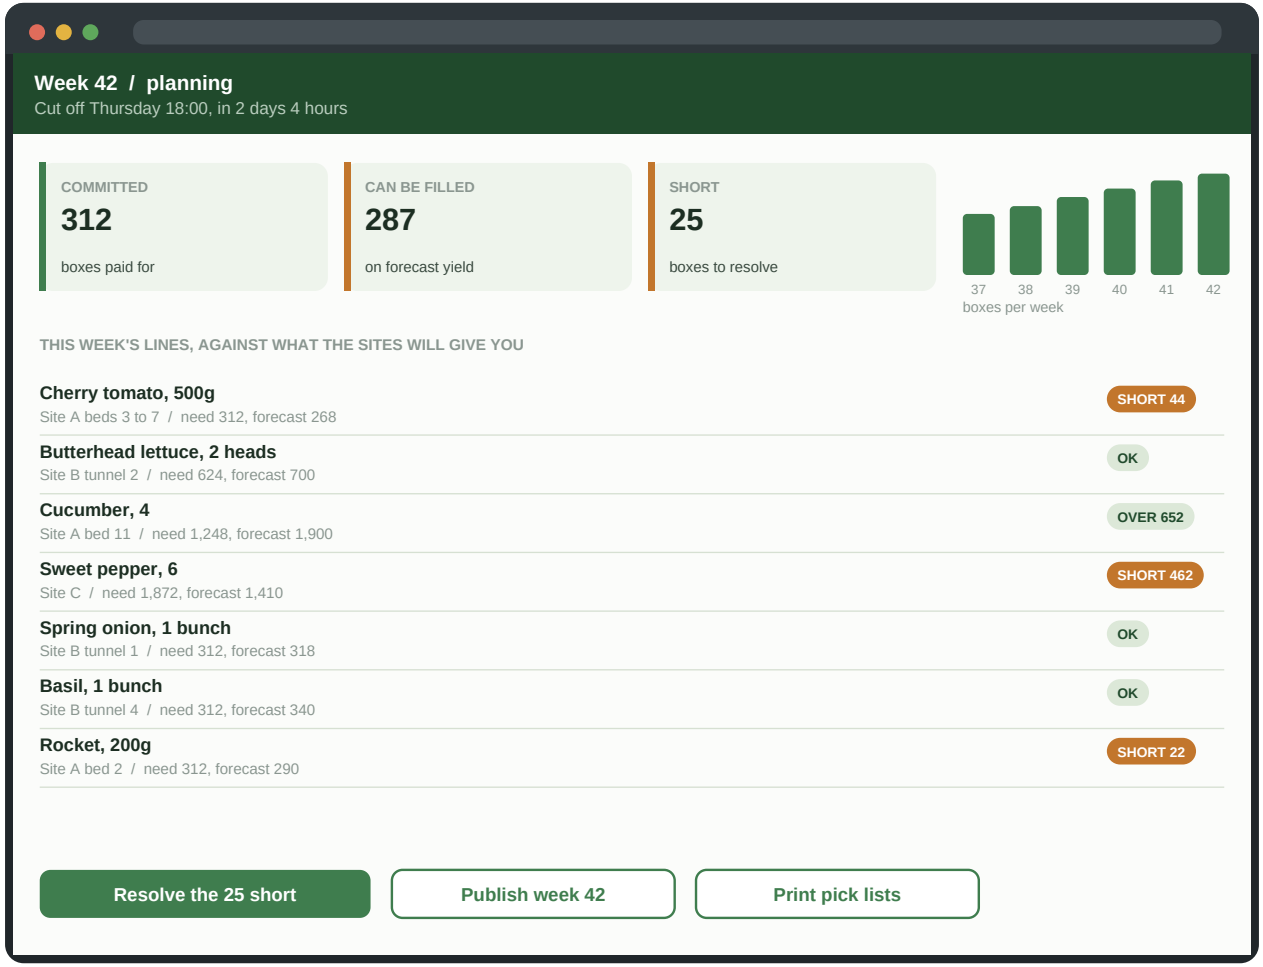

A retry schedule, a bank account that belongs to that customer alone, a wallet they can pre fund, and a skip that costs nothing. Four ways out of one problem, with the box reserved while they choose.

Pre funded wallets do the heavy lifting.

A customer who tops up once a month never sees this screen again. That is why the wallet leads at checkout rather than the card.

The harvest and box console.

One screen where demand and supply meet, so nobody sells a hundred boxes of something that is not ready.

WHAT THE BUTTONS ACTUALLY DO

Resolve the short.

Applies the substitution rules you set once, respects every customer's never list, and shows you the handful it cannot solve before you commit.

Publish the week.

Locks the box, opens ordering, starts the countdown and schedules the reminder that goes out on Wednesday evening.

Print the pick lists.

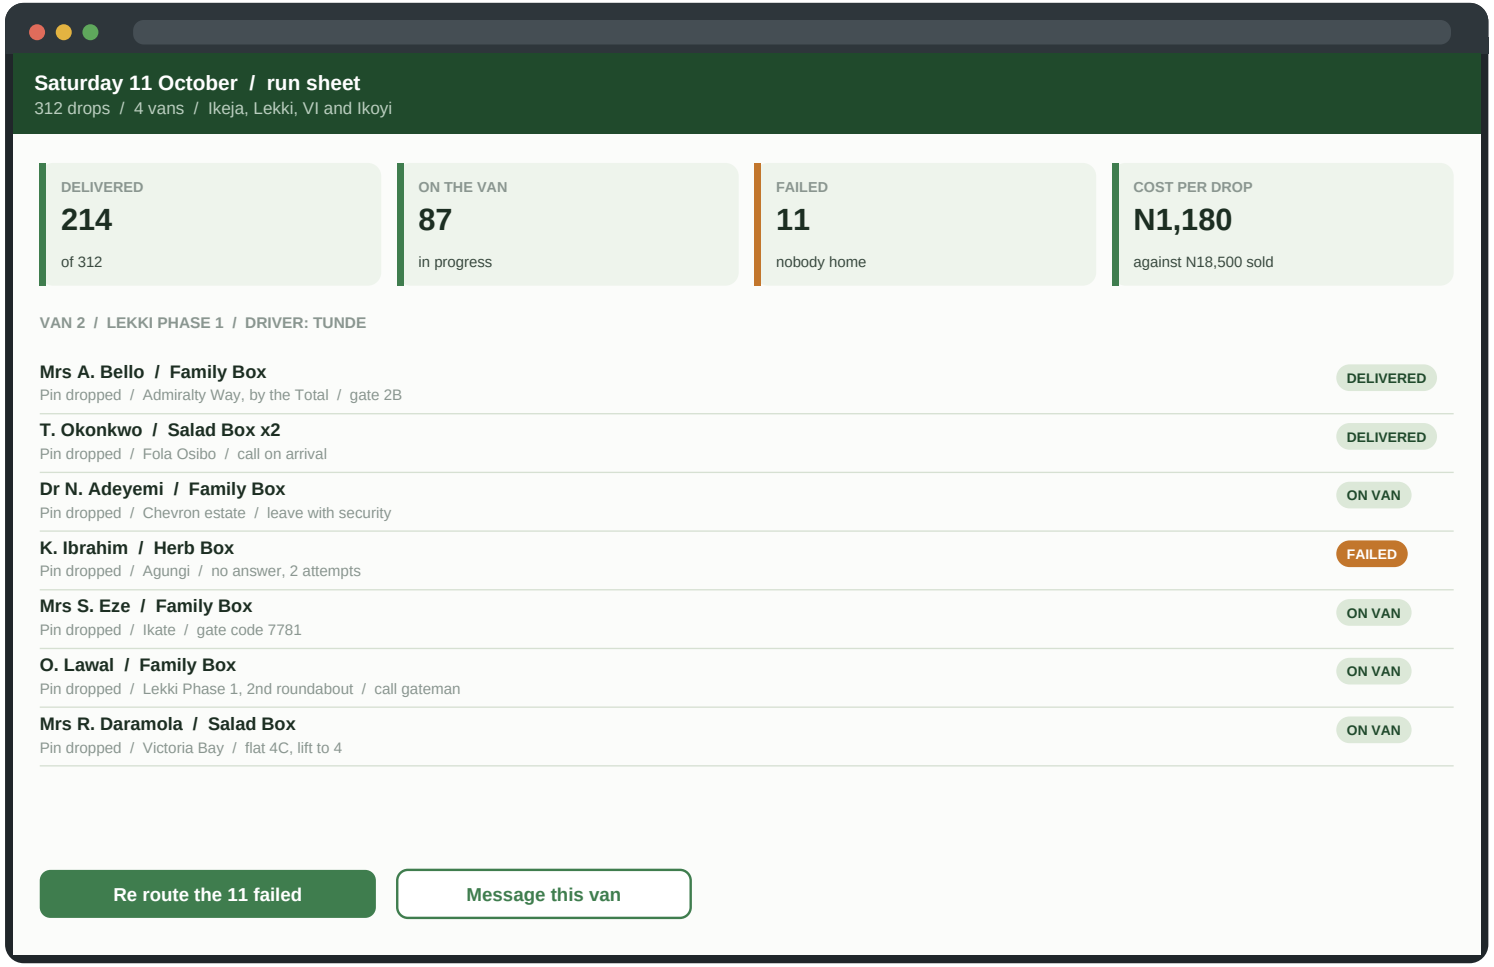

By site, by bed and by picker, in harvest order rather than customer order, which is the difference between a morning and a day.

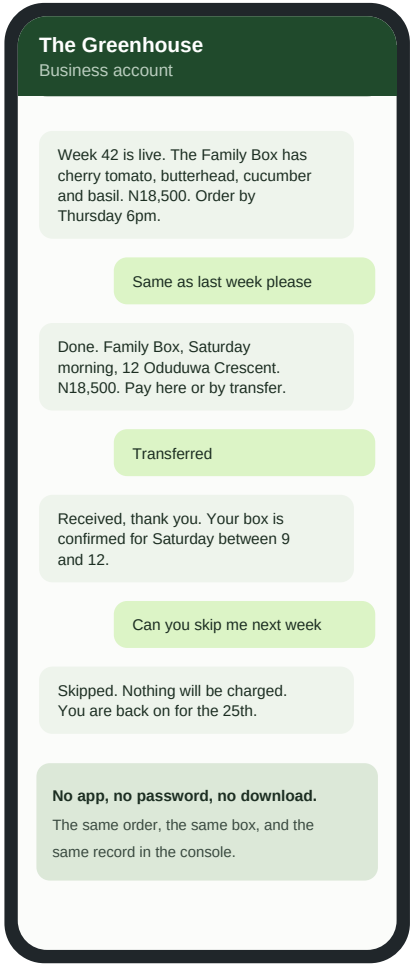

Route the surplus.

The 652 spare cucumbers become a discounted box, a wholesale line or a donation on a rule, rather than on somebody noticing in time.

Delivery day, and the customers who will never open an app.

Lagos addresses do not find a house, so the manifest carries a dropped pin, a landmark and a gate instruction rather than a street line.

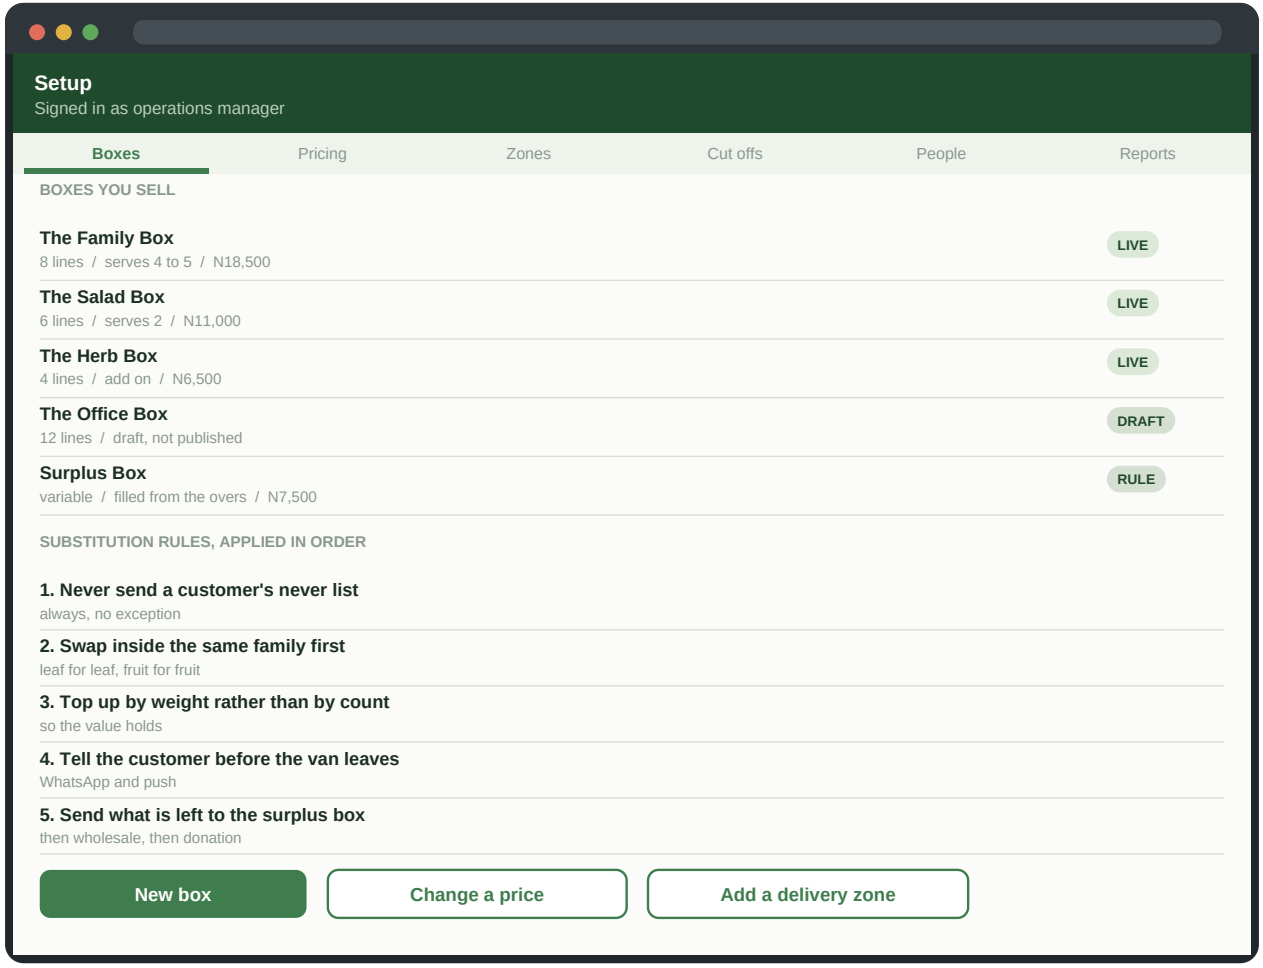

THE WHATSAPP THREAD

The admin portal, so you are not calling us to change a price.

Everything that will change in your first year is a setting rather than a change request.

WHAT YOU CONTROL WITHOUT US

- Create a box, set its lines, price it, publish it or hold it as a draft
- Change any price, with the change logged and dated
- Draw a delivery zone on a map and set what delivery costs inside it
- Move the cut off, the delivery days and the delivery windows
- Add a staff member and decide what they can see and do
- Set the substitution rules and where the surplus goes
- Issue a credit, a refund or a discount code
- Read the reports: boxes a week, value per box, churn, waste and cost to serve

Seven decisions that a general developer will get wrong, and you will pay for later.

The decision	The cheap answer	What it costs you
Inventory	A stock count per product, decremented when somebody buys	You do not know the count until the morning you cut. The correct shape is a commitment before a cut off, real yield entered at harvest, then an allocation across everyone who committed
Recurring payment	Attach a Paystack plan and let it run	Paystack does not retry a failed subscription charge, and a Verve card cannot auto renew at all. Without your own retry ladder, a transfer account and a wallet, a declined card becomes a cancelled customer
Addresses	A street address field on every order	Lagos addresses do not find a house. Capture a dropped pin, a landmark and a gate instruction once per customer, confirm it on the first delivery, then reuse it every week
The box	A product with a fixed description	Contents change weekly. Substitution needs a rule and a hierarchy, every customer needs a list of what never to send them, and they need telling before the van leaves rather than after
WhatsApp	Send messages when you want to	Since July 2025 Meta bills every template message by category. Tagging a delivery reminder as marketing rather than utility multiplies the bill, so the category belongs in the data model
Packing and the law	One compliance posture for everything	Whole produce and prepared produce are regulated completely differently. That is a flag per line, set once, not a conversation every time you add a product
Surplus	Nothing, because a shop has no surplus	Produce is worthless in four days. Routing the overs on a rule into a discounted box, a wholesale buyer or a donation is margin, and leaving it to somebody noticing is waste

None of this is exotic. It is the difference between somebody who has built a shop and somebody who has looked at how you run a Thursday.

What you may call it, and what you must register.

The question	The answer	What we build or do about it
Can we call it organic?	Nigeria has no statutory organic regime, so nobody can stop you and nobody is standing behind you either. The voluntary route is the Nigeria Organic Agriculture Standard, run by NOAN out of Ibadan on a participatory guarantee system, and NOAN is an IFOAM affiliate.	We would put the certification mark and the method on the product pages and on the box, because the claim is worth more when it is backed. Worth pursuing as a trust asset, not as compliance.
Does NAFDAC regulate our box?	It depends on how you pack it rather than on what you are. Whole, unwashed produce sits with agricultural quarantine and outside NAFDAC registration. The moment a line is cut, washed and bagged, or composed with anything else, NAFDAC's 2019 pre packaged food labelling rules apply.	A flag on every line in the data model for whether it is raw and whole or prepared, driving the label the packhouse prints. One field, set once, and you never have to think about it again.
What does holding customer data commit us to?	Past 200 customers in six months you are a data controller of major importance under the Nigeria Data Protection Act and its 2025 directive. That means registering with the NDPC, naming a data protection officer, running an impact assessment, and reporting a breach inside 72 hours. The NDPC issued compliance notices to 1,368 organisations in August 2025.	Consent capture, an export and delete path for a customer who asks, and the audit log, built in rather than retrofitted. Registration at your tier costs ten thousand naira and we would do it during the build.
Are we liable for card data?	Only if you hold it, and you should not. The CBN makes PCI DSS mandatory for anyone storing cardholder information.	We store the payment provider's token and never a card number, which keeps you outside that regime entirely.

One more that is about to matter. NIPOST launched a digital postcode system on 1 October 2026, aimed at the fifty to eighty billion naira a year the country loses to deliveries that never arrive. We would build the address capture to accept it when it becomes usable, and to work perfectly well without it.

Ten weeks, and what we need from you in each of them.

Weeks	What we do	What you do
1 to 2	Discovery. We sit with your harvest plan, your sites and whoever currently takes the orders, and we write down the box rules, the cut off, the zones and the substitution logic	Two days of your operations lead, your harvest records, and a decision on the first three boxes
2 to 3	Design. Every screen in this deck, drawn properly in your brand, signed off before anybody writes code	One sign off meeting. After this, changes cost time
3 to 7	Build. The customer app, the payments, the console and the admin portal, shown to you working at the end of every fortnight	An hour a fortnight to look at it and say what is wrong
7 to 8	The real data. Your boxes, your prices, your zones, your staff, your photography, loaded and checked	Product photography, and someone to sit with us while we load it
8 to 9	Testing with real customers. Twenty households order a real box and we watch where they stop	Twenty willing customers, and one real delivery Saturday
9 to 10	Launch and handover. Google Play listing, training for your team, written documentation, and we stay close for the first two weeks	Two half days of training for whoever runs it

What you own at the end, which is all of it.

This matters more than it sounds. A good deal of software sold to Nigerian businesses leaves the client renting their own customer list. Everything below is yours on the day we hand over, and none of it depends on us staying.

YOURS, IN YOUR NAME

- The source code, in a repository you own
- The domain, the hosting account and the database
- The Paystack account, the WhatsApp Business account, the Play listing
- Every customer record, order and harvest record, exportable
- The design files and the component library
- Written documentation and recorded training

AND WHAT WE COMMIT TO

- No lock in. If you move to another firm, we hand over and help them
- No commission on your sales, ever
- Your data is never used for anything but running your business
- Registered as a data controller under the Nigeria Data Protection Act, with the consent and deletion flows built in rather than added later
- If a defect from the build appears in the first ninety days, we fix it and do not bill it

The build, priced as the days it takes.

We price from named grades against the days each part actually needs, published, so a change in scope is a change in days rather than an argument about a number.

What	Days	Fee
Discovery, the box model and the harvest rules	3	N850,000
Experience design and the screens	5	N950,000
The customer ordering app	10	N1,550,000
Subscription and payments	6	N975,000
Harvest, box and admin console	10	N1,550,000
Delivery, manifest and WhatsApp	4	N650,000
Testing, launch and handover	4	N395,000
Standard, at the rate card	42	N6,920,000
Programme rate, one continuous mandate rather than seven engagements		(N692,000)
Net build fee	42	N6,228,000

GRADES

Principal
350k per day

Senior engineer
200k per day

Designer
150k per day

Engineer
125k per day

Test and data
90k per day

Billed
40 on signature
30 at design sign off
30 on go live

Fees are non refundable. Substitution of any named person is free. One reschedule of the programme is included. Third party costs, being the Google Play registration, hosting, WhatsApp message fees and the domain, are passed through at cost with no mark up.

Keeping it running, after it is running.

Software that takes money and holds customer records is not finished when it launches. Payment providers change their rules, browsers update, and the first three months of real customers will tell you things no amount of planning does.

PLATFORM CARE

N1,800,000 a year

N150,000 a month, billed monthly from go live

WHAT IT COVERS

- Hosting, monitoring and backups, with the bill shown at cost
- Security patching and dependency updates
- Keeping the payment and WhatsApp integrations working when the provider changes something
- Fixing anything broken, inside one working day
- Two days a quarter of small changes, which is where most of the requests actually land

WHAT IT DOES NOT

- New features beyond the two days a quarter, which are quoted as days at the same rate card
- A native app, which is a separate decision and a separate fee
- Your own third party costs, being hosting beyond the included tier, WhatsApp message fees and payment processing
- Running the business. We keep the software working, you sell the boxes

Year one, all in: N8,028,000. The build at N6,228,000 and the first year of care at N1,800,000.

Three things, and the first one is free.

- **Tell us the app question is settled.** If you still want a native app first, say so and we will price that instead rather than talk you out of it.
- **Give us a morning on a site.** We want to see a harvest planned and a box packed before we design anything. No charge, and nothing is owed after it.
- **Then we start.** Signature and the first instalment, and week one begins on the Monday after.

> *You are not buying a website. You are buying the ability to sell a harvest before you cut it.*

hello@consultforafrica.com / +234 913 813 8553 / consultforafrica.com / Lagos and Abuja
